Preface:

Adventures in Mathematics (Preparatory) is a fun and easy-to-teach three level series written especially for preschoolers. The series was written, edited, and evaluated by a team of experienced Early Childhood Education professionals. It recognizes the specific circumstances and problems of teaching mathematics in the preschool.

The book contains carefully planned, prepared, sequenced, and tried-and-tested activities that make preschoolers look forward to working on them.

The contents of this book include colors, shapes, sizes, lengths, heights, picture patterns, sets, numbers 0 to 20, ordering, comparing, and sequencing numbers, ordinal numbers, addition, subtraction, rational numbers, money, and time.

It is hoped that after going through the activities in this book, the preschoolers should be able to name, identify, classify, compare, describe, and explain the concepts involved in whole numbers, rational numbers, geometry, and measurement, to demonstrate the skills in addition, subtraction, and rational numbers; and to apply the concepts learned and the fundamental operations toward problem solving.
